- One way of checking the correctness of programs is to explore the possible states that a computation system can reach during the execution of the program.
- Problems with this *model checking* approach:
  - Models become infinite.
  - Satisfaction/validity becomes undecidable.
- In this lecture, we cover a proof-based framework for program verification.

TÀI LIỆU SƯU TẬP  
BỞI HCMUT-CNCP

BACHKHOACNCP.COM

# Characteristics of the Approach

Proof-based instead of model checking  
Semi-automatic instead of automatic  
Property-oriented not using full specification  
Application domain fixed to sequential programs using integers  
Interleaved with development rather than a-posteriori verification

# Reasons for Program Verification

**Documentation.** Program properties formulated as theorems can serve as concise documentation

**Time-to-market.** Verification prevents/catches bugs and can reduce development time

**Reuse.** Clear specification provides basis for reuse

**Certification.** Verification is required in safety-critical domains such as nuclear power stations and aircraft cockpits

**Convert** informal description  $R$  of *requirements* for an application domain into formula  $\phi_R$ .

**Write** program  $P$  that meets  $\phi_R$ .

**Prove** that  $P$  satisfies  $\phi_R$ .

Each step provides risks and opportunities.

# Motivation of Core Language

- Real-world languages are quite large; many features and constructs
- Theoretical constructions such as Turing machines or lambda calculus are too far from actual applications; too low-level
- Idea: use subset of Pascal/C/C++/Java
- Benefit: we can study useful “realistic” examples

Expressions come as arithmetic expressions  $E$ :

$$E ::= n \mid x \mid (-E) \mid (E + E) \mid (E - E) \mid (E * E)$$

and boolean expressions  $B$ :

$$B ::= \text{true} \mid \text{false} \mid (!B) \mid (B \& B) \mid (B \parallel B) \mid (E < E)$$

Where are the other comparisons, for example  $==$ ?

## Example

Consider the factorial function:

$$\begin{aligned} 0! &\stackrel{\text{def}}{=} 1 \\ (n+1)! &\stackrel{\text{def}}{=} (n+1) \cdot n! \end{aligned}$$

We shall show that after the execution of the following Core program, we have  $y = x!$ .

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

TÀI LIỆU SƯU TẬP  
BỞI HCMUT-CNCP

BACHKHOACNCP.COM

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

- We need to be able to say that at the end, y is x!

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

- We need to be able to say that at the end,  $y$  is  $x$ !
- That means we require a *post-condition*  $y = x$ !

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

- Do we need pre-conditions, too?

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

- Do we need pre-conditions, too?

**Yes, they specify what needs to be the case before execution.**

Example:  $x > 0$

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

- Do we need pre-conditions, too?

**Yes, they specify what needs to be the case before execution.**

Example:  $x > 0$

- Do we have to prove the postcondition in one go?

## Example

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

- Do we need pre-conditions, too?

**Yes, they specify what needs to be the case before execution.**

Example:  $x > 0$

- Do we have to prove the postcondition in one go?

**No, the postcondition of one line can be the pre-condition of the next!**

# Assertions on Programs

## Shape of assertions

$$\langle\phi\rangle P \langle\psi\rangle$$

## Informal meaning

If the program  $P$  is run in a state that satisfies  $\phi$ , then the state resulting from  $P$ 's execution will satisfy  $\psi$ .

## (Slightly Trivial) Example

### Informal specification

Given a positive number  $x$ , the program  $P$  calculates a number  $y$  whose square is less than  $x$ .

### Assertion

$$(x > 0) \ P \ (y \cdot y < x)$$

### Example for $P$

$$y = 0$$

### Our first Hoare triple

$$(x > 0) \ y = 0 \ (y \cdot y < x)$$

## (Slightly Less Trivial) Example

### Same assertion

$$((x > 0) \wedge P \wedge (y \cdot y < x))$$

### Another example for $P$

```
y = 0;  
while (y * y < x) {  
  y = y + 1;  
}  
y = y - 1;
```

### Definition

Let  $\mathcal{F}$  contain function symbols and  $\mathcal{P}$  contain predicate symbols. A model  $\mathcal{M}$  for  $(\mathcal{F}, \mathcal{P})$  consists of:

- 1 A non-empty set  $A$ , the *universe*;
- 2 for each nullary function symbol  $f \in \mathcal{F}$  a concrete element  $f^{\mathcal{M}} \in A$ ;
- 3 for each  $f \in \mathcal{F}$  with arity  $n > 0$ , a concrete function  $f^{\mathcal{M}} : A^n \rightarrow A$ ;
- 4 for each  $P \in \mathcal{P}$  with arity  $n > 0$ , a set  $P^{\mathcal{M}} \subseteq A^n$ .

The model  $\mathcal{M}$  satisfies  $\phi$  with respect to environment  $l$ , written  $\mathcal{M} \models_l \phi$ :

- in case  $\phi$  is of the form  $P(t_1, t_2, \dots, t_n)$ , if the result  $(a_1, a_2, \dots, a_n)$  of evaluating  $t_1, t_2, \dots, t_n$  with respect to  $l$  is in  $P^{\mathcal{M}}$ ;
- in case  $\phi$  has the form  $\forall x \psi$ , if the  $\mathcal{M} \models_{l[x \mapsto a]} \psi$  holds for all  $a \in A$ ;
- in case  $\phi$  has the form  $\exists x \psi$ , if the  $\mathcal{M} \models_{l[x \mapsto a]} \psi$  holds for some  $a \in A$ ;

## Recall: Satisfaction Relation (continued)

- in case  $\phi$  has the form  $\neg\psi$ , if  $\mathcal{M} \models_l \psi$  does not hold;
- in case  $\phi$  has the form  $\psi_1 \vee \psi_2$ , if  $\mathcal{M} \models_l \psi_1$  holds or  $\mathcal{M} \models_l \psi_2$  holds;
- in case  $\phi$  has the form  $\psi_1 \wedge \psi_2$ , if  $\mathcal{M} \models_l \psi_1$  holds and  $\mathcal{M} \models_l \psi_2$  holds; and
- in case  $\phi$  has the form  $\psi_1 \rightarrow \psi_2$ , if  $\mathcal{M} \models_l \psi_1$  holds whenever  $\mathcal{M} \models_l \psi_2$  holds.

## Definition

An assertion of the form  $\langle \phi \rangle P \langle \psi \rangle$  is called a Hoare triple.

- $\phi$  is called the precondition,  $\psi$  is called the postcondition.
- A state of a Core program  $P$  is a function  $l$  that assigns each variable  $x$  in  $P$  to an integer  $l(x)$ .
- A state  $l$  satisfies  $\phi$  if  $\mathcal{M} \models_l \phi$ , where  $\mathcal{M}$  contains integers and gives the usual meaning to the arithmetic operations.
- Quantifiers in  $\phi$  and  $\psi$  bind only variables that do *not* occur in the program  $P$ .

BỞI HCMUT-CNCP

BACHKHOACNCP.COM

## Example

Let  $l(x) = -2$ ,  $l(y) = 5$  and  $l(z) = -1$ . We have:

- $l \models \neg(x + y < z)$
- $l \not\models y = x \cdot z < z$
- $l \not\models \forall u(y < u \rightarrow y \cdot z < u \cdot z)$

## Partial Correctness

### Definition

We say that the triple  $\langle \phi \rangle P \langle \psi \rangle$  is *satisfied under partial correctness* if, for all states which satisfy  $\phi$ , the state resulting from  $P$ 's execution satisfies  $\psi$ , provided that  $P$  terminates.

### Notation

We write  $\models_{\text{par}} \langle \phi \rangle P \langle \psi \rangle$ .

## Extreme Example

$\langle\phi\rangle$  `while true { x = 0; }  $\langle\psi\rangle$`

holds for all  $\phi$  and  $\psi$ .

## Definition

We say that the triple  $\langle\phi\rangle P \langle\psi\rangle$  is *satisfied under total correctness* if, for all states which satisfy  $\phi$ ,  $P$  is guaranteed to terminate and the resulting state satisfies  $\psi$ .

## Notation

We write  $\models_{\text{tot}} \langle\phi\rangle P \langle\psi\rangle$ .

We are looking for a proof calculus that allows us to establish

$$\vdash_{\text{par}} \langle \phi \rangle P \langle \psi \rangle$$

where

- $\models_{\text{par}} \langle \phi \rangle P \langle \psi \rangle$  holds whenever  $\vdash_{\text{par}} \langle \phi \rangle P \langle \psi \rangle$  (correctness), and
- $\vdash_{\text{par}} \langle \phi \rangle P \langle \psi \rangle$  holds whenever  $\models_{\text{par}} \langle \phi \rangle P \langle \psi \rangle$  (completeness).

# Rules for Partial Correctness

$$\frac{(\phi) C_1 (\eta) \quad (\eta) C_2 (\psi)}{(\phi) C_1; C_2 (\psi)} [\text{Composition}]$$

[Assignment]

$$\langle [x \rightarrow E] \psi \rangle \ x = E \ \langle \psi \rangle$$

## Examples

Let  $P$  be the program  $x = 2$ .

Using

$$\frac{}{([x \rightarrow E]\psi) \ x = E \ (\psi)} \text{[Assignment]}$$

we can prove:

- $\langle 2 = 2 \rangle \ P \ \langle x = 2 \rangle$
- $\langle 2 = 4 \rangle \ P \ \langle x = 4 \rangle$
- $\langle 2 = y \rangle \ P \ \langle x = y \rangle$
- $\langle 2 > 0 \rangle \ P \ \langle x > 0 \rangle$

## More Examples

Let  $P$  be the program  $x = x + 1$ .

Using

$$\frac{}{([x \rightarrow E]\psi) \ x = E \ (\psi)} \text{[Assignment]}$$

we can prove:

- $(x + 1 = 2) \ P \ (x = 2)$
- $(x + 1 = y) \ P \ (x = y)$

## Rules for Partial Correctness (continued)

$$\frac{\langle \phi \wedge B \rangle C_1 \langle \psi \rangle \quad \langle \phi \wedge \neg B \rangle C_2 \langle \psi \rangle}{\langle \phi \rangle \text{ if } B \{ C_1 \} \text{ else } \{ C_2 \} \langle \psi \rangle} \text{[If-statement]}$$

$$\frac{\langle \psi \wedge B \rangle C \langle \psi \rangle}{\langle \psi \rangle \text{ while } B \{ C \} \langle \psi \wedge \neg B \rangle} \text{[Partial-while]}$$

## Rules for Partial Correctness (continued)

$$\frac{\vdash_{AR} \phi' \rightarrow \phi \quad (\phi) C (\psi) \quad \vdash_{AR} \psi \rightarrow \psi'}{(\phi') C (\psi')} \text{[Implied]}$$

# Proof Tableaux

## Proofs have tree shape

All rules have the structure

As a result, all proofs can be written as a tree.

## Practical concern

These trees tend to be very wide when written out on paper. Thus we are using a linear format, called *proof tableaux*.

## Interleave Formulas with Code

$$\frac{(\phi) C_1 (\eta) \quad (\eta) C_2 (\psi)}{(\phi) C_1; C_2 (\psi)} \text{[Composition]}$$

Shape of rule suggests format for proof of  $C_1; C_2; \dots; C_n$ :

$(\phi_0)$   
 $C_1;$   
 $(\phi_1)$       justification  
 $C_2;$   
 $\vdots$   
 $(\phi_{n-1})$     justification  
 $C_n;$   
 $(\phi_n)$       justification

Contents

## Overall goal

Find a proof that at the end of executing a program  $P$ , some condition  $\psi$  holds.

## Common situation

If  $P$  has the shape  $C_1; \dots; C_n$ , we need to find the weakest formula  $\psi'$  such that

$$\langle \psi' \rangle C_n \langle \psi \rangle$$

## Terminology

The weakest formula  $\psi'$  is called *weakest precondition*.

## Example

$(y < 3)$

$(y + 1 < 4)$

$y = y + 1;$

$(y < 4)$

Implied

Assignment

TÀI LIỆU SƯU TẬP

Correctness of the  
Factorial Function

Proof Calculus for  
Total Correctness

Homeworks

## Another Example

Can we claim  $u = x + y$  after  $z = x; z = z + y; u = z; ?$

$(\top)$

$(x + y = x + y)$  Implied

$z = x;$

$(z + y = x + y)$  Assignment

$z = z + y;$

$(z = x + y)$  Assignment

$u = z;$

$(u = x + y)$  Assignment

## An Alternative Rule for If

We have:

$$\frac{\langle \phi \wedge B \rangle C_1 \langle \psi \rangle \quad \langle \phi \wedge \neg B \rangle C_2 \langle \psi \rangle}{\langle \phi \rangle \text{ if } B \{ C_1 \} \text{ else } \{ C_2 \} \langle \psi \rangle} \text{[If-statement]}$$

Sometimes, the following *derived rule* is more suitable:

$$\frac{\langle \phi_1 \rangle C_1 \langle \psi \rangle \quad \langle \phi_2 \rangle C_2 \langle \psi \rangle}{\langle (B \rightarrow \phi_1) \wedge (\neg B \rightarrow \phi_2) \rangle \text{ if } B \{ C_1 \} \text{ else } \{ C_2 \} \langle \psi \rangle} \text{[If-stmt 2]}$$

## Example

Consider this implementation of Succ:

```
a = x + 1;  
if (a - 1 == 0) {  
  y = 1;  
} else {  
  y = a;  
}
```

Can we prove  $(\top) \text{Succ } (y = x + 1)$  ?

## Another Example

⋮

if (  $a - 1 == 0$  ) {

$(1 = x + 1)$

If-Statement 2

$y = 1;$

$(y = x + 1)$

Assignment

} else {

$(a = x + 1)$

If-Statement 2

$y = a;$

$(y = x + 1)$

Assignment

}

$(y = x + 1)$

If-Statement 2

## Another Example

$\langle \top \rangle$   
 $\langle (x + 1 - 1 = 0 \rightarrow 1 = x + 1) \wedge$   
 $(\neg(x + 1 - 1 = 0) \rightarrow x + 1 = x + 1) \rangle$  Implied  
 $a = x + 1;$   
 $\langle (a - 1 = 0 \rightarrow 1 = x + 1) \wedge$   
 $(\neg(a - 1 = 0) \rightarrow a = x + 1) \rangle$  Assignment  
**if** (  $a - 1 == 0$  ) {  
     $\langle 1 = x + 1 \rangle$  If-Statement 2  
     $y = 1;$   
     $\langle y = x + 1 \rangle$  Assignment  
} **else** {  
     $\langle a = x + 1 \rangle$  If-Statement 2  
     $y = a;$   
     $\langle y = x + 1 \rangle$  Assignment

## Recall: Partial-while Rule

$$\frac{(\psi \wedge B) \ C \ (\psi)}{(\psi) \ \text{while } B \ \{ C \} \ (\psi \wedge \neg B)} \quad [\text{Partial-while}]$$

## Factorial Example

We shall show that the following Core program Fac1 meets this specification:

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

Thus, to show:

$$\langle \top \rangle \text{ Fac1 } \langle y = x! \rangle$$

## Ideas for Total Correctness

- The only source of non-termination is the `while` command.
- If we can show that the value of an integer expression decreases in each iteration, but never becomes negative, we have proven termination.  
Why? Well-foundedness of natural numbers
- We shall include this argument in a new version of the `while` rule.

## Rules for Partial Correctness (continued)

$$\frac{(\psi \wedge B) \ C \ (\psi)}{(\psi) \ \text{while } B \ \{ C \} \ (\psi \wedge \neg B)} \quad [\text{Partial-while}]$$

$$\frac{(\psi \wedge B \wedge 0 \leq E = E_0) \ C \ (\psi \wedge 0 \leq E < E_0)}{(\psi \wedge 0 \leq E) \ \text{while } B \ \{ C \} \ (\psi \wedge \neg B)} \quad [\text{Total-while}]$$

## Factorial Example (Again!)

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

What could be a good variant  $E$ ?

## Factorial Example (Again!)

```
y = 1;  
z = 0;  
while (z != x) { z = z + 1; y = y * z; }
```

What could be a good variant  $E$ ?

$E$  must strictly decrease in the loop, but not become negative.

while (z != x) { z = z + 1; y = y * z; }
```

What could be a good variant  $E$ ?

$E$  must strictly decrease in the loop, but not become negative.

Answer:

$$x - z$$

# Total Correctness of Fac1

```
⋮
⋮
( $y = z! \wedge 0 \leq x - z$ )
while (  $z \neq x$  ) {
    ( $y = z! \wedge z \neq x \wedge 0 \leq x - z = E_0$ )
    ( $y \cdot (z + 1) = (z + 1)! \wedge 0 \leq x - (z + 1) < E_0$ )
     $z = z + 1$ ;
    ( $y \cdot z = z! \wedge 0 \leq x - z < E_0$ )
     $y = y * z$ ;
    ( $y = z! \wedge 0 \leq x - z < E_0$ )
}
( $y = z! \wedge \neg(z \neq x)$ )
( $y = x!$ )
```
